

Application No. 08/666,164
Amendment dated Nov. 12, 2004
Reply to Office Action of Sept. 14, 2004

94-rTRN-387

Amendments to the Claims:

Please amend the claims as indicated below. Please cancel claims 1, 6, 8, 14, 17, 18, 20, 22, 23, 26-30, 33 and 54-57.

To the extent that any of claims 35-53 and 58-144 are open, please cancel such claims.

Listing of Claims:

1. (canceled)

2. (amended): A method for controlling an at least partially automated vehicular mechanical transmission system comprising a fuel-controlled engine, an engine controller from controlling fueling of the engine in accordance with command output signals, a multiple-speed mechanical transmission having an input shaft driven by the engine and an output shaft and a control unit for receiving input signals and processing same according to predetermined logic rules to issue command output signals, said method characterized by:

determining a level of engine fueling required to cause substantially zero torque to the input shaft under current vehicle operating conditions; and

controlling said system as a function of said level of engine fueling. ~~The method of claim 4~~ wherein said level of engine fueling is the engine fuel required to cause T_{EG} to substantially equal the sum of T_{BEF} , T_{ACCES} and T_{ACCEL} where

T_{EG} = gross engine torque;
 T_{BEF} = base engine friction torque;
 T_{ACCES} = accessory torque; and
 T_{ACCEL} = torque to accelerate the engine.

3. (amended): A method for controlling an at least partially automated vehicular mechanical transmission system comprising a fuel-controlled engine, an engine controller from controlling fueling of the engine in accordance with command output signals, a multiple-speed mechanical transmission having an input shaft driven by the engine and an output shaft and a control unit for receiving input signals and processing same according to predetermined logic rules to issue command output signals, said method characterized by:

94-rTRN-387

determining a level of engine fueling required to cause substantially zero torque to the input shaft under current vehicle operating conditions; and

controlling said system as a function of said level of engine fueling. The method of claim 4 wherein said level of engine fueling is the engine fuel required to cause T_{EG} to substantially equal the sum of T_{BEF} and T_{ACCES} where

T_{EG} = gross engine torque;
 T_{BEF} = base engine friction torque; and
 T_{ACCES} = accessory torque.

4. (original): The method of claim 2 wherein said engine communicates with said control unit by means of an electronic data link and said command output signals include a signal transmitted on said data link and requiring the engine to develop a specified gross engine torque (T_{EG}).

5. (original): The method of claim 3 wherein said engine communicates with said control unit by means of an electronic data link and said command output signals include a signal transmitted on said data link and requiring the engine to develop a specified gross engine torque (T_{EG}).

6. (canceled)

7. (amended): A method for controlling an at least partially automated vehicular mechanical transmission system comprising a fuel-controlled engine, an engine controller from controlling fueling of the engine in accordance with command output signals, a multiple-speed mechanical transmission having an input shaft driven by the engine and an output shaft and a control unit for receiving input signals and processing same according to predetermined logic rules to issue command output signals, said method characterized by:

determining a level of engine fueling required to cause substantially zero torque to the input shaft under current vehicle operating conditions; and

controlling said system as a function of said level of engine fueling, wherein said system includes a sensor for sensing operator-set throttle position and for providing an input signal indicative thereof, said method further comprising causing said engine to be fueled at said level of engine fueling for a first period of time upon sensing said throttle pedal being

94-rTRN-387

moved to a minimum displacement position thereof, further~~The method of claim 6 wherein~~
said first period of time is about 300 to 450 milliseconds.

8. (canceled)

9. (amended): A method for controlling an at least partially automated vehicular mechanical transmission system comprising a fuel-controlled engine, an engine controller from controlling fueling of the engine in accordance with command output signals, a multiple-speed mechanical transmission having an input shaft driven by the engine and an output shaft and a control unit for receiving input signals and processing same according to predetermined logic rules to issue command output signals, said method characterized by: determining a level of engine fueling required to cause substantially zero torque to the input shaft under current vehicle operating conditions; and controlling said system as a function of said level of engine fueling, wherein said system includes a sensor for sensing operator-set throttle position and for providing an input signal indicative thereof, said method further comprising causing said engine to be fueled at said level of engine fueling for a second period of time upon sensing said throttle pedal being moved from a minimum displacement position thereof, further~~The method of claim 8~~
wherein said second period of time is about 100 to 300 milliseconds.

10. (original): The method of claim 2 wherein said system includes a sensor for sensing operator-set throttle position and for providing an input signal indicative thereof, said method further comprising causing said engine to be fueled at said level of engine fueling for a first period of time upon sensing said throttle pedal being moved to a minimum displacement position thereof.

11. (original): The method of claim 10 wherein said first period of time is about 300 to 450 milliseconds.

12. (original): The method of claim 2 wherein said system includes a sensor for sensing operator-set throttle position and for providing an input signal indicative thereof, said method further comprising causing said engine to be fueled at said level of engine fueling for a second period of time upon sensing said throttle pedal being moved from a

94-rTRN-387

minimum displacement position thereof.

13. (original): The method of claim 12 wherein said second period of time is about 100 to 300 milliseconds.

14. (canceled)

15. (original): The method of claim 2 wherein said system includes a transmission controller for controlling shifting of said transmission in accordance with command output signals, said method further comprising causing said engine to be fueled at said level of engine fueling when disengaging of a transmission ratio is required.

16. (canceled): The method of claim 4 2 wherein said system includes a transmission controller for controlling shifting of said transmission in accordance with command output signals, said method further comprising causing said engine to be fueled at said level of engine fueling when engaging of a transmission ratio is required.

17. (canceled)

18. (canceled)

19. (original): The method of claim 2 wherein said engine has a first mode of operation wherein engine fueling is in accordance with operator demand and a second mode of operation wherein engine fueling is not a function of operator demand, said method further comprising causing said engine to be fueled to said level of engine fueling when transitioning from said second to said first mode of operation.

20. (canceled)

21. (original): The method of claim 15 wherein said engine is caused to be fueled at a level dithering about said level of engine fueling when disengaging of a transmission ratio is required.

22. (canceled)

94-rTRN-387

23. (canceled)

24. (canceled)

25. (amended): A vehicular semi-automated shift implementation system comprising:

a manually shifted transmission having an input shaft driven by a fuel-controlled engine, an output shaft and a plurality of selectably engageable and disengageable jaw clutches allowing selection of a plurality of drive ratios and neutral, said jaw clutches selectively positioned by a manually operated shift lever having a plurality of selectable shift lever positions defining a shift pattern;

means for determining a level of engine fueling required to cause substantially zero torque to the input shaft under current vehicle operating conditions; and

means to sense conditions indicative of an operator intention to shift said transmission into neutral and effective, upon sensing conditions indicative of an operator intention to shift into neutral, to automatically cause said engine to be fueled to said level of engine fueling. ~~The system of claim 24~~ wherein said level of engine fueling is the engine fuel required to cause T_{EG} to substantially equal the sum of T_{BEF} , T_{ACCES} and T_{ACCEL} where

T_{EG} = gross engine torque;
 T_{BEF} = base engine friction torque;
 T_{ACCES} = accessory torque; and
 T_{ACCEL} = torque to accelerate the engine.

Claims 26 – 30 (canceled)

31. (original): The control method of claim 2 wherein said engine and said control unit communicate over an electronic data link (DL) carrying signals indicative of gross engine torque (T_{EG}) and base engine friction torque (T_{BEF}).

32. (original): The system of claim 25 wherein said engine and said control unit communicate over an electronic data link (DL) carrying signals indicative of gross engine torque (T_{EG}) and base engine friction torque (T_{BEF}).
